

Remediation Evidence — YouTube API Services ToS Violations Report V.1

API Client: Gala Labs Co., Lt · Project number 197088978210 · Report dated August 13, 2026

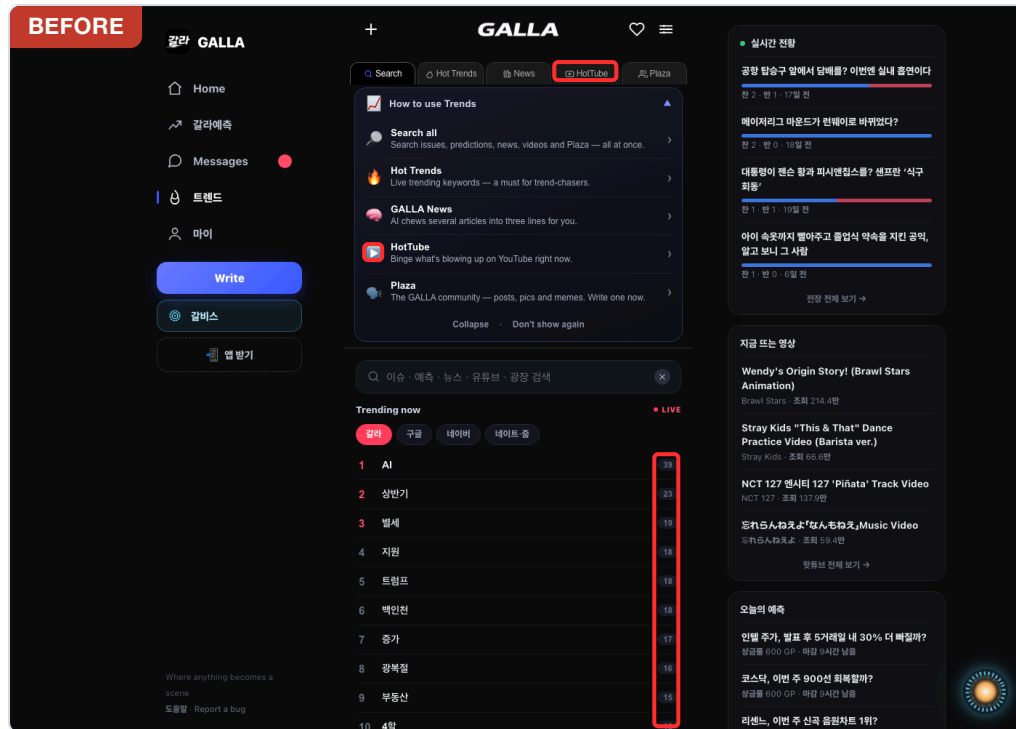

This document shows, side by side, the state of our product **before** and **after** the changes made in response to your report. Every "after" screenshot reflects what is live right now at **https://galla.im**. Both columns were captured in the same browser, at the same viewport (1400 × 1000), in the **English locale** — the same view your reviewer used.

Policy	What you reported	What we changed
III.D.1c	Confirm whether multiple project numbers are used.	Two projects exist; both disclosed. Only <code>galla-youtube</code> (197088978210) accesses YouTube API Services. <code>galla-analytics</code> (634912808454) is Google Analytics only — YouTube Data API v3 is not enabled there.
III.A.2g	Privacy policy does not disclose storage of / access to information on users' devices, including cookies or similar technology.	New Section 11 added, enumerating cookies, local storage, service worker cache, device identifiers and push tokens — including third-party storage by YouTube/Google — and how to refuse it.
III.A.2i	API Client does not provide contact information.	Section 12 rewritten. It previously contained an unfilled placeholder; it now names the operator, the responsible person, an email address, in-product support routes and a response time.
III.E.4h	Independently calculated or derived metrics. "Kindly replace the highlighted symbol with the term <i>likes</i> ."	(a) YouTube like counts now read as "... likes ". (b) Our own like is labelled " GALLA likes ". (c) On the screens you highlighted, our metric panels are no longer rendered. (d) Trending keyword counts now state their source on screen.
III.F.2a	YouTube logos and icons do not follow the Branding Guidelines.	We had recreated the YouTube mark ourselves as inline SVG, including a modified outline variant. Every instance removed across the codebase. No YouTube mark now appears anywhere outside the official embedded player.

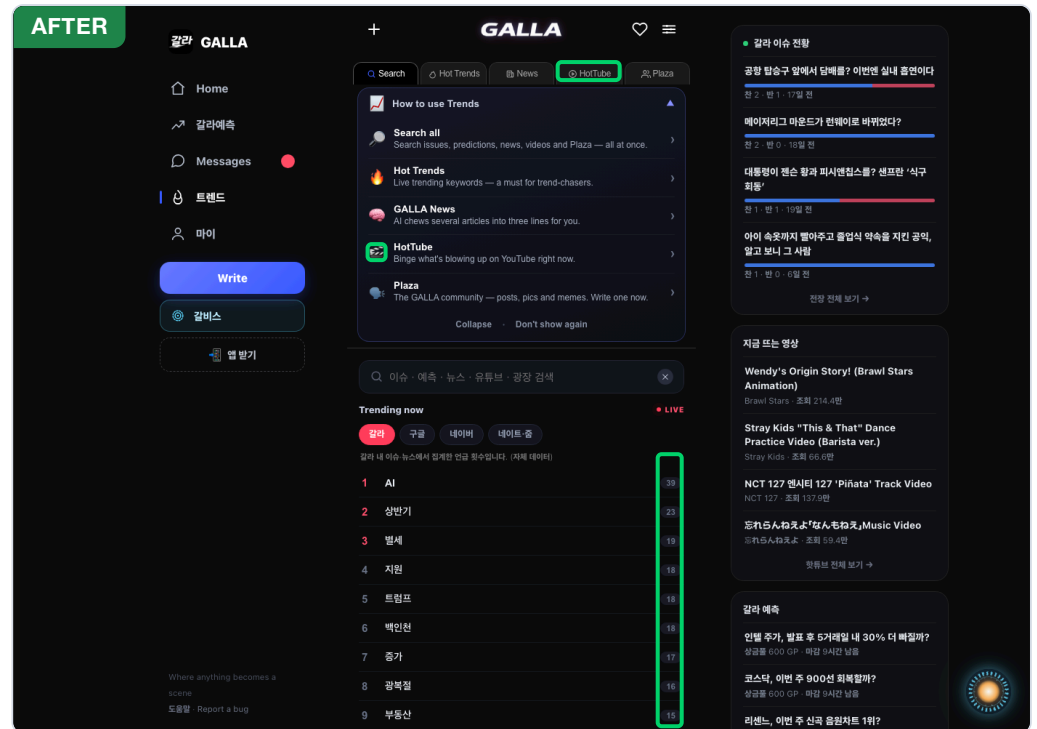

How to read the annotations. Red boxes on the left ("BEFORE") mark the elements your report highlighted. Green boxes on the right ("AFTER") mark the same location after remediation.

III.F.2a Branding — trends hub

Screen: /search · corresponds to page 5 of your report

A hand-drawn copy of the YouTube mark was used as our tab icon and as the entry icon in the onboarding list. The number column at right had no stated source.

Both icons replaced with a neutral mark in our own brand colour. A caption above the list now states where the figures come from — for the tab shown here it reads "Counts of mentions aggregated from issues and news inside GALLA (our own data)".

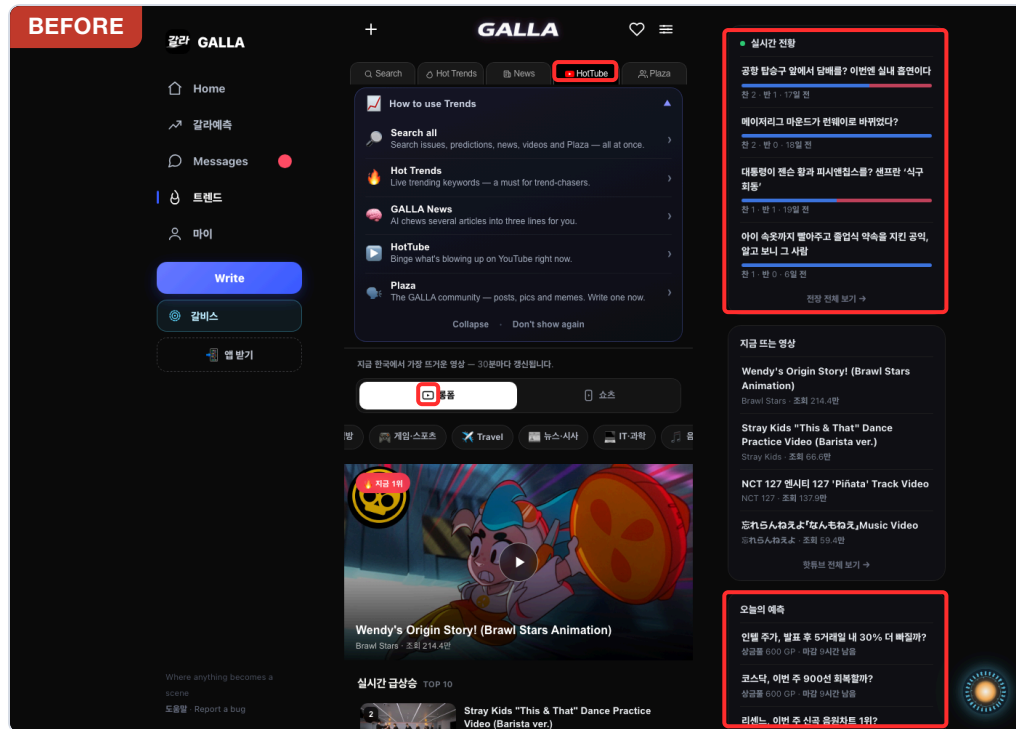

III.F.2a

+

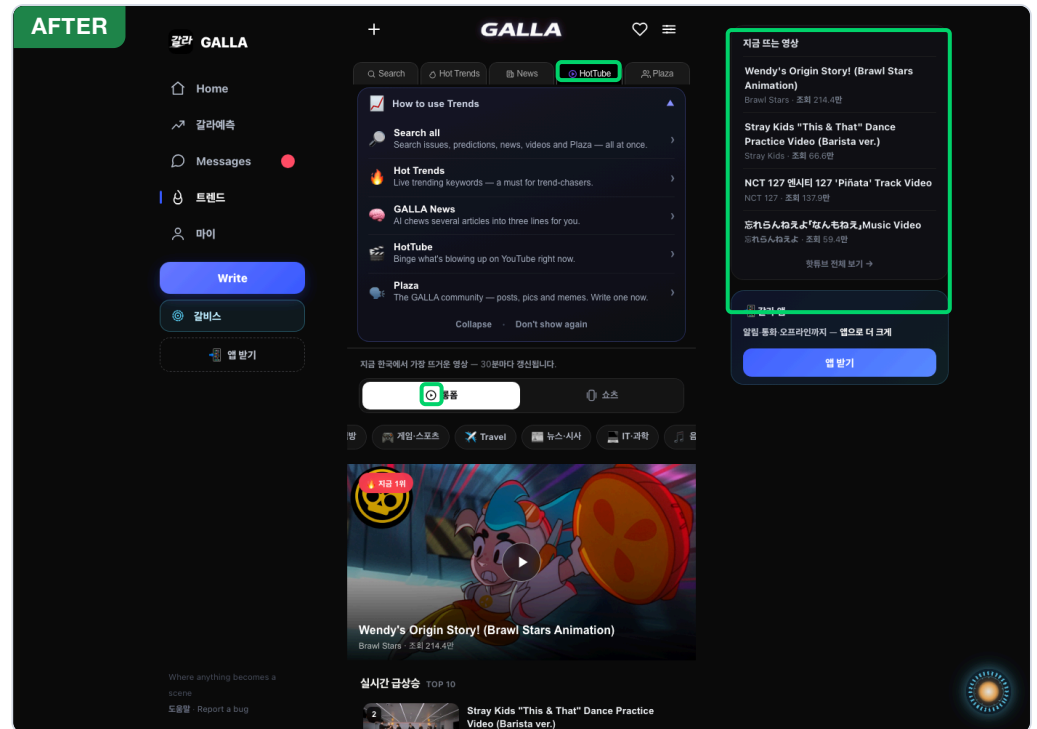

III.E.4h

Video section — icons, like counts, and adjacent panels

Screen: /search?tab=hot · the "Long-form" toggle is the element highlighted in the second screenshot on page 5

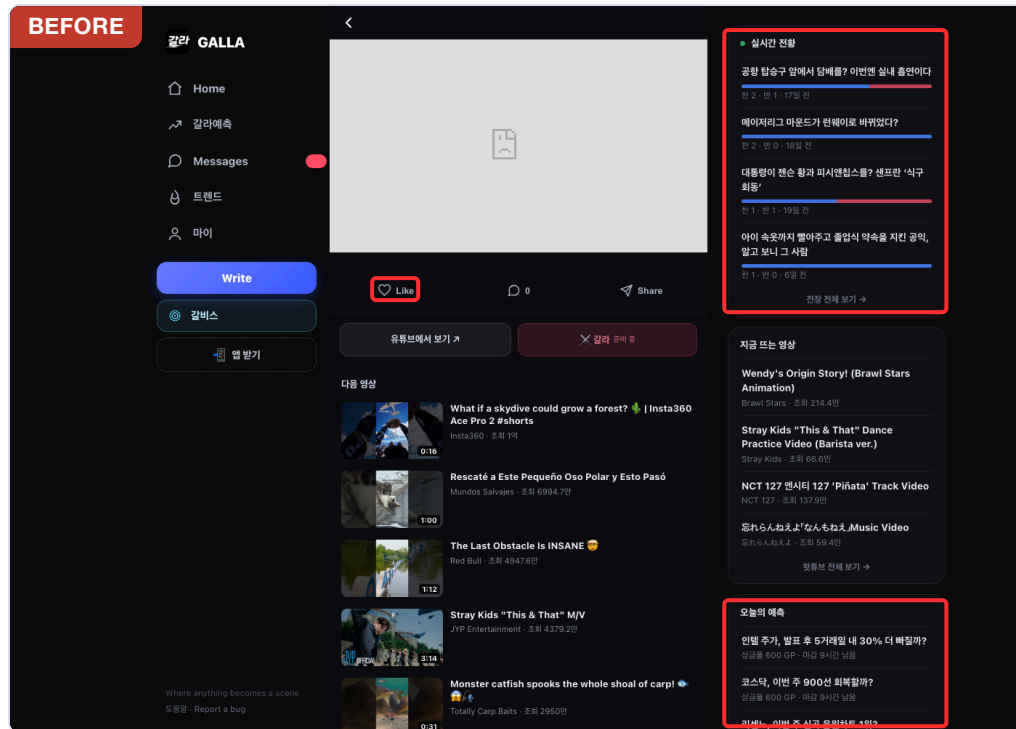

Top: our copy of the YouTube mark on the tab and on the "Long-form" toggle. Right: our own issue vote tallies and prediction market sat directly beside YouTube content, which could be read as metrics derived from it.

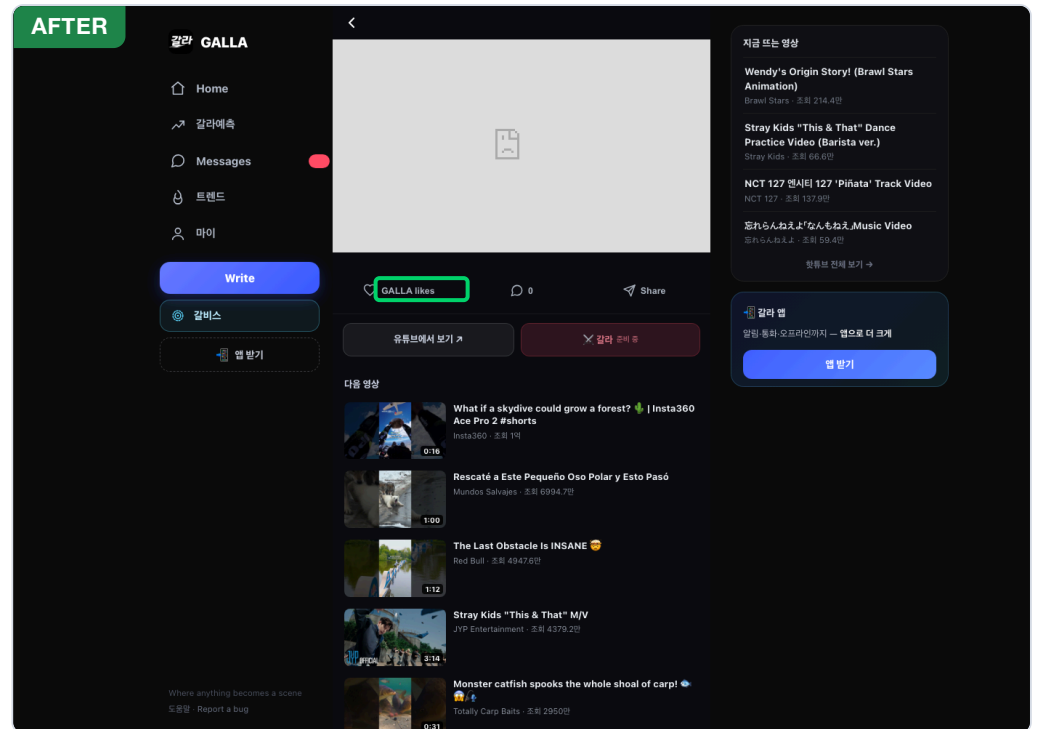

Icons replaced. Both metric panels are no longer rendered on any screen that shows YouTube content; only a plain video list and an app-download card remain.

III.E.4h Watch screen — "likes" wording and adjacent panels

Screen: /watch · corresponds to pages 2 and 3 of your report

The element you highlighted: a heart symbol labelled only "Like". Right: the same two panels ("Live Standings", "Today's Prediction") beside the player.

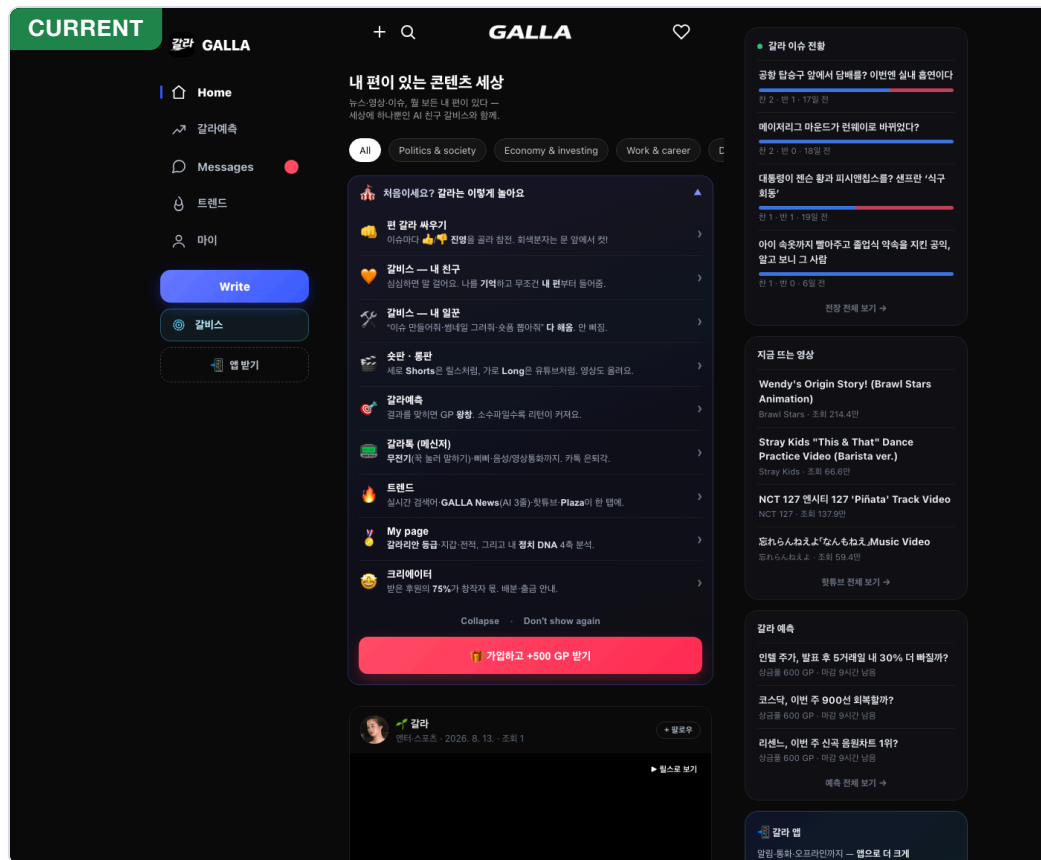

The control now reads "GALLA likes" — the word is always present, and the GALLA prefix makes clear the count is ours and not YouTube's. Both metric panels are gone from this screen.

Where we display **YouTube's own** like count (on video cards), it is now rendered as the value followed by the word "likes" — the value returned by the API, shown unmodified, with the word "likes" as you asked. We do not compute or publish any metric derived from YouTube API data.

III.E.4h What the highlighted panels actually are

Addressing the screenshots on pages 2 (lower), 3 and 4 of your report — panels we did **not** change, and why they are not derived metrics

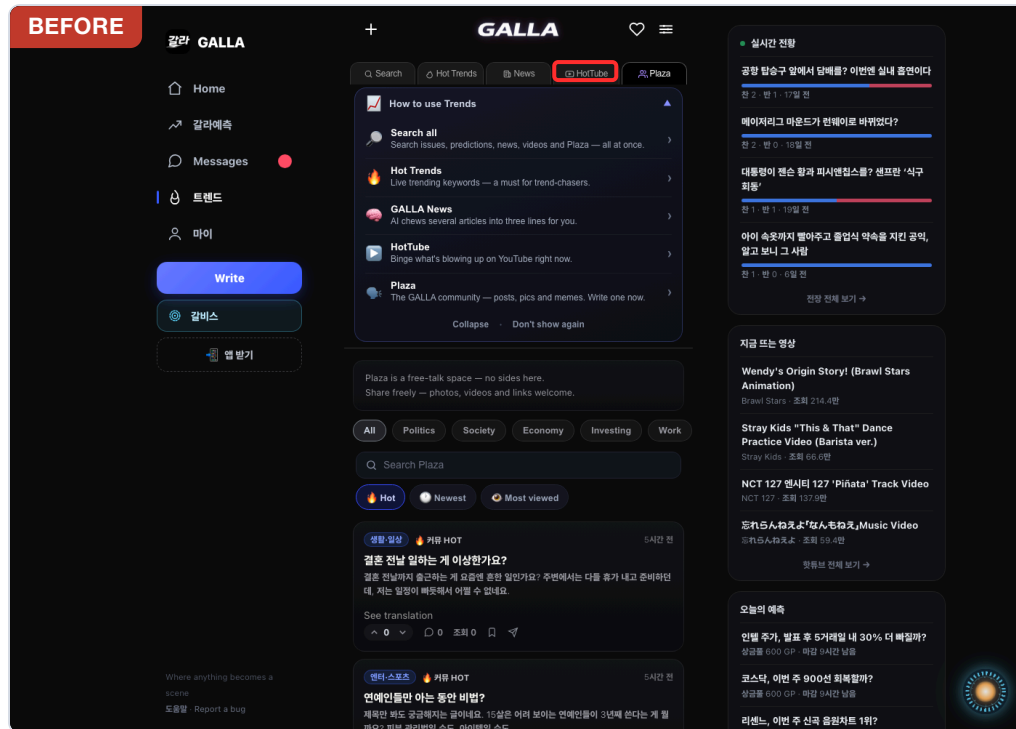

Our home screen. Each of our own panels carries the GALLA name on its face — "GALLA Issue Standings" and "GALLA Prediction" — and sits in its own card, separate from the video list.

Element you highlighted	What it is and where the number comes from
Live Standings (now "GALLA Issue Standings")	Counts of agree / disagree votes cast by GALLA users on debate topics written on GALLA. Source: our own database. Not about videos.
GALLA Prediction YES / NO percentages	A prediction feature on general news, economy and sports questions authored by GALLA and its users — for example "Will Google exceed 50% domestic search share this month?". The percentages are the distribution of in-app points our users have placed on each side.
"Trading volume ... P"	The total of those in-app points. "P" is GP, a virtual point that exists only inside GALLA; it cannot be cashed out and has no monetary value. It is a measure of participation in our own feature.
Trending keyword counts	Either mentions aggregated from issues and news inside GALLA, or figures supplied by Google, Naver or Nate·Zoom, depending on the source tab the user selects. The source is now stated on screen above the list.

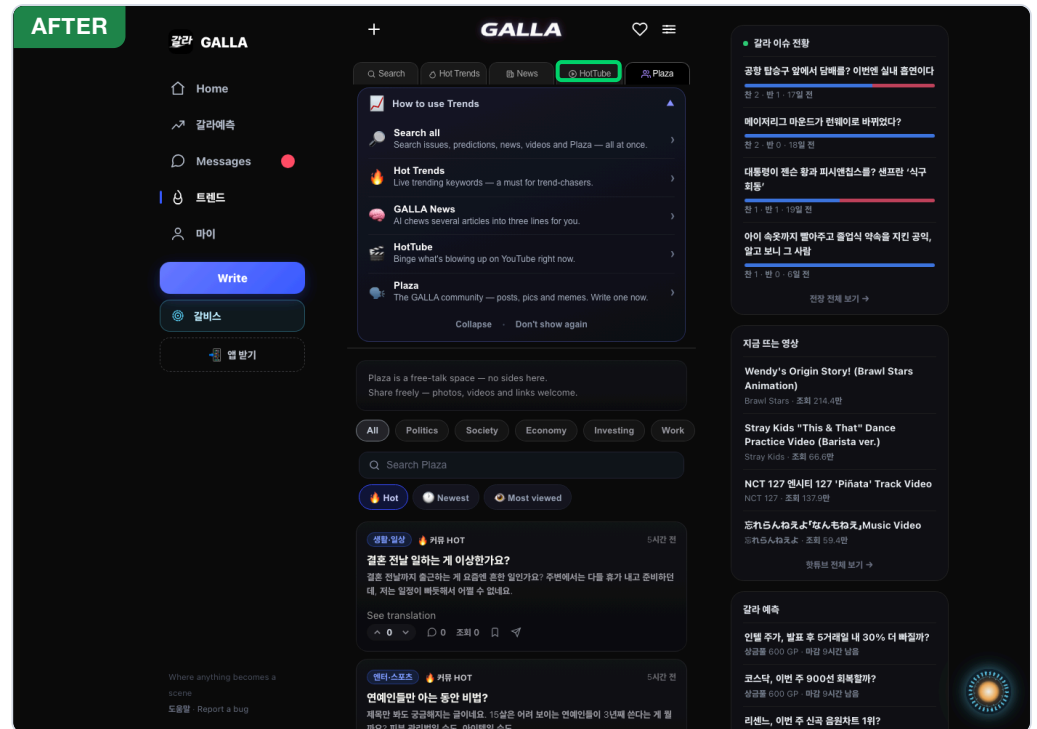

None of these values takes any input from the YouTube API, and none of the topics is about a YouTube video. They are not calculated from YouTube data, do not replace anything YouTube provides, and are never presented as YouTube figures. For that reason we have kept the features themselves, and instead made their ownership explicit on screen and removed them entirely from the two screens you highlighted.

III.F.2a Branding — community screen

Screen: /plaza · a second copy of the same tab bar that we missed on our first pass

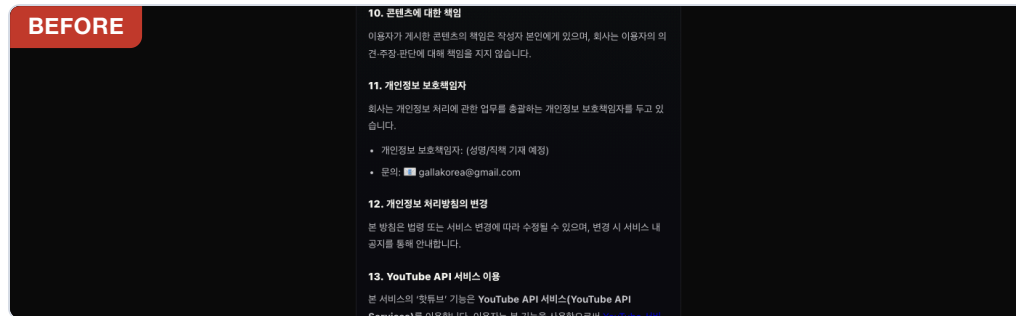

The same mark appeared here because the tab bar had been duplicated into a second file.

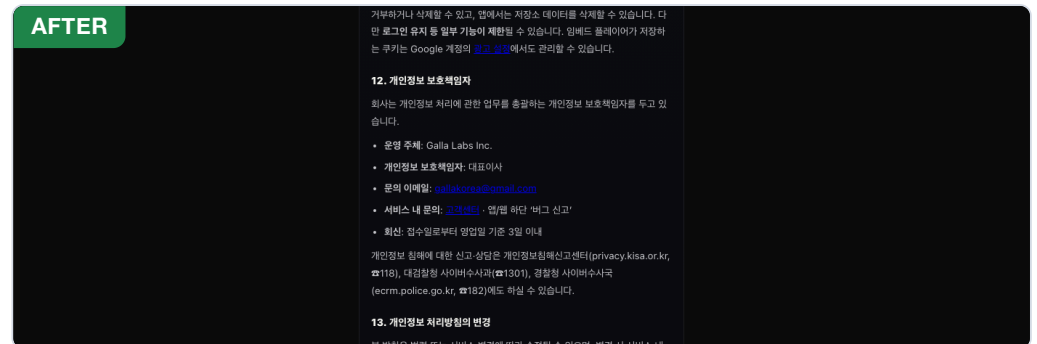

Replaced. We searched the whole repository for the YouTube red (#FF0000) and for the rounded-rectangle-plus-play-triangle geometry; there are now zero occurrences. YouTube is still identified as the source wherever we show its content — the official IFrame Player, a "Watch on YouTube" link on every video screen, and the channel name on every video. If you would rather we display the official YouTube icon in these positions, we will implement it unmodified at no less than 20dp, linking back to YouTube — please just say which you prefer.

III.A.2i Contact information

Page: <https://galla.im/privacy> — same section, before and after

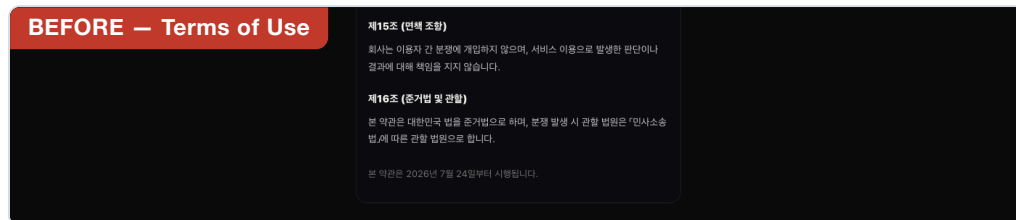

The section existed but the responsible person was an unfilled placeholder — literally "(name/title to be entered)". That is what your report identified as missing contact information.

Operator, responsible person, email, in-product support routes and a stated response time. Korean data-protection authority contacts are listed below it.

Because this item sits under **API Client Terms of Use and Privacy Policies**, we added the same contact block to our Terms of Use, which previously carried no contact details at all.

The document ended at Article 16 with no way to reach us.

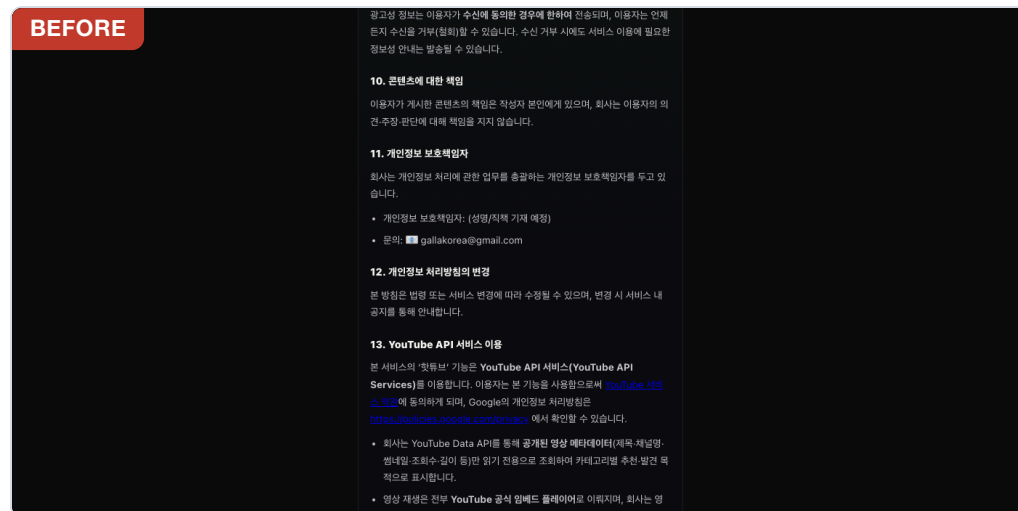

New Article 17 — "Company information and contact".

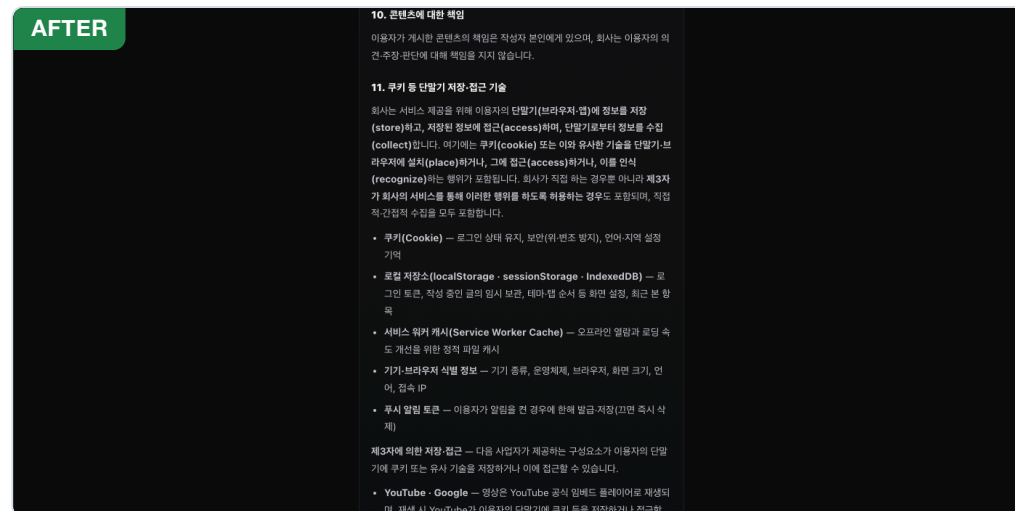

Our policy is published in Korean. The section shown on the right reads, in translation: Operator — Galla Labs Inc. | Data Protection Officer — Representative Director | Contact email — gallakorea@gmail.com | In-service — Help Center and the "Report a bug" entry in the footer of every page | Response — within 3 business days. We are happy to provide a full English translation of the policy on request.

III.A.2g Disclosure of on-device storage and access

Page: <https://galla.im/privacy> — a new section was added at the same position

No section on device storage. Cookies appeared only as one word inside a list of automatically collected items, with no mention of local storage, service worker cache, or third-party storage and access.

New Section 11. It uses your policy's own verbs — we **store** information on, **access** information from and **collect** information from users' devices, including by **placing, accessing or recognizing** cookies or similar technology, directly or indirectly, and including where we allow third parties to do so.

Section 11 discloses — in translation	Third-party storage and access
• Cookies — login state, security, language/region preferences • Local storage (localStorage, sessionStorage, IndexedDB) — auth tokens, draft posts, UI preferences, recently viewed items • Service Worker cache — offline reading, load performance • Device / browser identifiers — device type, OS, browser, screen size, language, IP • Push notification tokens — only when the user enables notifications	• YouTube and Google — playback uses the official YouTube embedded player, and YouTube may store or access cookies and similar technologies on the user's device. The Google Privacy Policy and the YouTube Terms of Service are linked directly from this section. • Supabase, Cloudflare — session cookies for authentication and security • How to refuse — browser cookie settings, clearing app storage, and Google Ad Settings for cookies set by the embedded player; the section also states which features stop working if the user does so.
